WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBITITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds" and beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

RESTRICTED

●●●●●●●●●● COLDs, INFLUENZA, ETC.

The graph displays the annual rate of admission per 1000 strength for three years: 1942, 1943, and 1944. The x-axis represents the months from July to June. The y-axis represents the annual rate of admission per 1000 strength, with a scale from 0 to 1200. A vertical line is drawn between December and January. The data series for 1942 (solid line), 1943 (dashed line), and 1944 (dotted line) all show a significant peak in December, with 1943 reaching the highest peak of approximately 1150. The 1944 data is only plotted for the period from July to January.

WEEKLY HEALTH REPORT

WEEK ENDING 21 JANUARY 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3, the admission rate from all causes and from all diseases combined decreased slightly during the week ending 21 January 1944, as did the admission rate from colds, influenza, etc. For the country as a whole there has been little change in morbidity from all causes and from all diseases combined during the first three weeks of January. For the week ending 21 January 1944, the all causes rate at 854 per thousand per year and the corresponding all diseases rate of 785 per thousand per year were both about 15 percent lower than for the week ending 22 January 1943 at which time, however, admissions from respiratory causes were close to their highest for the early months of 1943.

The admission rate for colds, influenza, etc. for the week ending 21 January 1944 was reported at 350 per thousand per year or practically the same as during the preceding two weeks. This was about 30 percent below the relatively high rate from these causes reported for the week ending 22 January 1943. Morbidity from all forms of pneumonia continued low, on substantially the same level as in recent weeks.

The admission rate from injury for the week ending 21 January 1944 was also the same as reported for the preceding two weeks, on the relatively low level of about 70 per thousand.

For the fourth successive week, the number of cases of measles, mumps, and scarlet fever all showed pronounced increases. The number of new cases of measles was almost 40 percent higher than reported for the preceding week, while mumps and scarlet fever new cases were both about 15 percent higher than the preceding week. The number of new cases of meningitis showed only a small increase. The new cases of rheumatic fever continued practically as high as during the preceding week, which registered the largest number in any week since June 1943.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

Morbidity from all causes and from all diseases combined increased markedly in the Third Service Command and the Military District of Washington. Substantial decreases in morbidity were reported from the Second and First Service Commands.

The increased morbidity from all causes and from disease in the Third Service Command and the Military District of Washington reflected for the most part higher admission rates from colds, influenza, etc. Because of an outbreak of food poisoning at Camp Kilmer during the week ending 14 January 1944, which was soon placed under control, lower morbidity was reported for the week ending 21 January 1944 from the Second Service Command. The lower morbidity from all causes and from disease in the First Service Command was all due to lower admission rates from colds, influenza, etc.

The highest rate of morbidity from all causes - in excess of 1100 per thousand per year - was reported from the Seventh Service Command, which also reported the highest admission rate from colds, influenza, etc., in excess of 500 per thousand. Morbidity rates from all causes in excess of 1000 per thousand were also reported by the Third and Sixth Service Commands, which experienced admission rates from colds, influenza, etc. in excess of 450 per thousand. The lowest morbidity from all causes and from

WEEKLY HEALTH REPORT

WEEK ENDING 21 JANUARY 1944

COMMENT ON CURRENT TRENDS (CONT'D)

disease was registered in the First Service Command, this being the only Service Command to report morbidity from colds, influenza, etc. considerably under 300 per thousand.

The largest numbers of new cases of measles were reported from the Fourth, Seventh and Eighth Service Commands, which accounted for more than 75 percent of the total. The largest number of new cases of mumps was reported from the Fourth Service Command, which together with the Ninth Service Command accounted for more than 50 percent of the total. The new cases of scarlet fever were more uniformly distributed throughout the country with the Seventh and Ninth Service Commands accounting for over 40 percent of the total. The Seventh Service Command continued to report the largest number of new cases of rheumatic fever.

NON EFFECTIVE RATE

The mean number of non-effectives for the country as a whole was reported at 40 per thousand for the week ending 21 January 1944 or about the same as during the preceding week. The largest increase in the non-effective rate was reported from the Military District of Washington which also showed a substantial increase in admission rates.

The differences in the non-effective rates by Service Command do not reflect so much the variations in morbidity in the Service Commands as the varying number of General Hospitals. When comparisons are made between the non-effective rates by Service Command excluding General Hospitals, the differences between the non-effective rates by Service Command are seen to be very much smaller than when the days lost in the General Hospitals are included.

CURRENT HOSPITALIZATION CONDITIONS

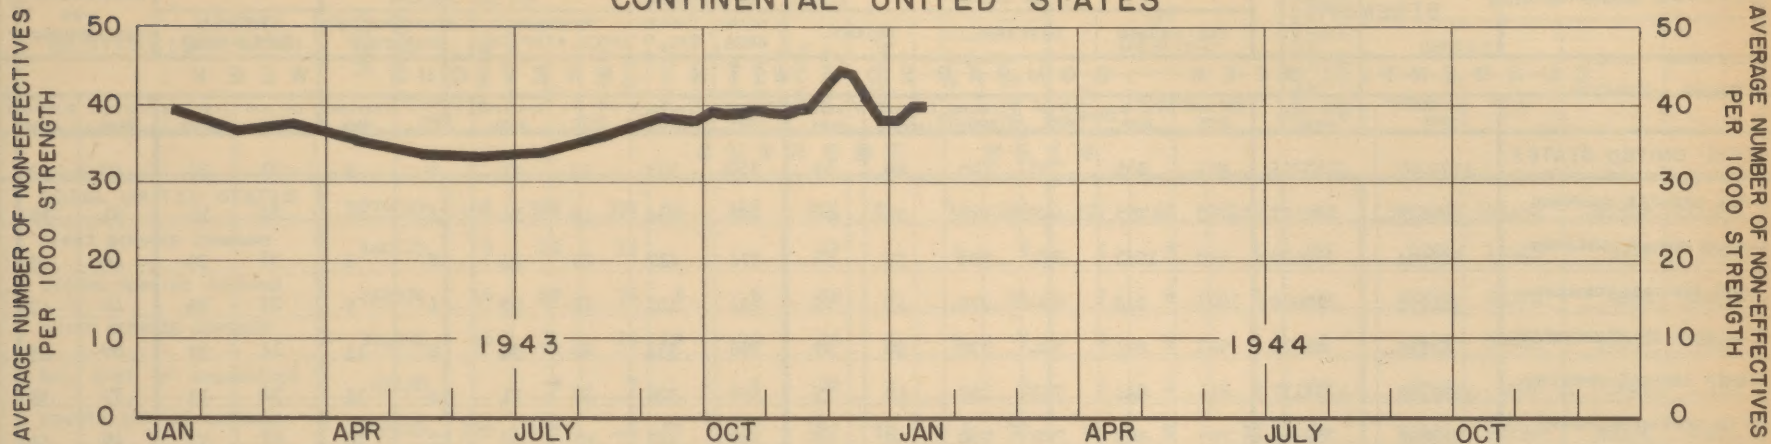

The total bed capacity reported as of 21 January 1944 was somewhat over 365,000. This apparent decrease in capacity of about 3,000 beds as compared with 14 January 1944 represents in part a change in the basis of reporting bed capacity and not an actual decrease.

The number of beds occupied as of 14 January 1944 was about 182,500 or practically the same number as the previous week; the number of "available vacant" beds decreased to about 111,000. On 21 January there were 27 stations with a bed capacity of about 25,000 which had no "available vacant" beds; included among them were 7 general hospitals with a bed capacity of about 13,500 beds.

On 21 January 1944 there were 2,193 cases of malaria remaining under treatment, all but 36 of which had presumably been acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was reported at 16,461 while the number of tuberculosis cases remaining totaled 1,070.

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 31 DEC. 1943

COMMENT ON RECENT DEVELOPMENTS

NATURE OF THE DATA

The data of this supplementary report, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. However, unlike the Weekly Health Reports which are compiled on the basis of figures as received, so as to place the information in circulation at the earliest possible time, the figures here presented for the five week period ending 31 December 1943 include the great majority of the corrected reports as well as reports received too late to be incorporated in the Weekly Reports.

This supplementary report includes morbidity data for all individual stations with a strength of 1,000 or over and gives details for admissions from venereal diseases and for neuropsychiatric cases. On pages 37 and 38 there are presented charts showing the morbidity trends for specified diseases during 1942 and 1943. On pages 40-72 appear the data for individual stations, while on page 39 is the summary for the United States as a whole and for the Service Commands. On pages 73-74 the six stations with the highest rates of admission during the five week period ending 31 December 1943 are shown for the various morbidity categories.

In reading the detailed tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol "?" has been placed after rates computed on the basis of 5 or fewer cases.

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

During the five week period ending 31 December 1943 the admission rates from all causes and from all diseases combined rose very sharply from the very low level which had prevailed during the preceding two months to over 1000 per year per thousand strength. This rise reflected a very sharp increase in admissions from colds, influenza, etc. which began in the latter part of November and reached a peak for the country as a whole during the second week of December. The admission rates from all causes and from all diseases combined for December 1943 were both about 13 percent higher than those for December 1942, chiefly because of higher morbidity from respiratory causes. The admission rate from injury decreased for the fifth consecutive month to the very low level of 66 per year per thousand strength, or the same as for January 1943 which was the lowest ever recorded.

As in November, the December admission rates from all causes and from all diseases combined varied considerably by Service Command. The Eighth and Ninth Service Commands because of their relatively low morbidity from respiratory causes, showed the lowest rates from all causes and all diseases combined - about 10 percent below those for the continental United States as a whole - while the Seventh Service Command which experienced the highest morbidity from respiratory causes in December had the highest rates - about

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

35 percent higher than for the country as a whole. The First, Second, Third, Fifth, and Sixth Service Commands all reported injury admission rates of about 55 per thousand, or about 15 percent lower than for the entire United States, while the highest injury rates in December (about 72 per thousand) were registered in the Fourth and Eighth Service Commands; these rates were nonetheless relatively low in relation to past experience.

RESPIRATORY DISEASES

The admission rate from colds, influenza, etc. for the five week period ending 31 December 1943 rose sharply to about 550 per year per thousand strength, in contrast with a rate of 150 per thousand for November and a level of about 100 per thousand for the period from July through October. This substantially higher morbidity resulted from outbreak of a mild form of influenza which began to manifest itself in the latter part of November and for the country as a whole passed its peak during the second week of December. By the end of December the admission rates from colds, influenza, etc. fell below those for December 1942 even though for the entire month of December 1943 they averaged about 10 per cent higher. All Service Commands experienced a sizeable increase in morbidity from colds, influenza, etc. but in varying degrees. The highest morbidity recorded from these causes in December was in the Seventh Service Command where the rate increased from about 260 per thousand in November to almost 850 per thousand in December. The lowest morbidity from colds, influenza, etc. was in the Eighth and Ninth Service Commands, both of which reported rates of about 430 per thousand. The outbreak of respiratory infections spread from the Sixth and Seventh Service Commands to the Fifth, Third and Second Service Commands, then to the First Service Command and the Military District of Washington and finally to the Fourth, Eighth and Ninth Service Commands.

As compared with January 1941 which represented the peak of the last relatively serious influenza epidemic, the admission rate from colds, influenza, etc. experienced in December 1943 was less than half as high for the country as a whole. Only in the Sixth and Ninth Service Commands (both of which showed relatively low morbidity during the January 1941 epidemic) did the admission rates from colds, influenza, etc. come within striking distance of the high rates experienced in January 1941.

Morbidity from pneumonia (including atypical) was appreciably higher in December than in November, although the relative increase in the rate (about 70 percent) was considerably less than that which occurred for colds, influenza, etc. (about 280 percent). In December the highest morbidity from pneumonia was experienced in the Military District of Washington and the Seventh Service Command both of which showed rates somewhat in excess of 40 per thousand, or more than double the rate for the United States as a whole; in contrast, the Fifth, Eighth, and Ninth Service Commands had the lowest rates, only about 15 per thousand. As in preceding months, atypical pneumonia has continued to represent about 40 percent of the total pneumonia cases in the United States although this proportion has varied widely by Service Command, with the highest percentage of atypical pneumonia being reported in December from the Military District of Washington and the Fourth and Fifth Service Commands and the lowest from the Second and Seventh Service

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

Commands.

DIARRHEA AND DYSENTERY

Morbidity from diarrhea and dysentery increased slightly in December as compared with November but was at a relatively high level as compared with December 1942 when the rate was only about 60 percent as high. Morbidity from this cause was highest in the Second and Fifth Service Commands both of which reported rates in excess of 15 per thousand as a result of several minor outbreaks.

VENEREAL DISEASES

The admission rate from all venereal disease combined, excluding EPTI cases, remained at about the same level in December as it had been during the preceding two months. As in previous months, gonorrhea made up the great majority (about 75 percent) of the total morbidity from venereal disease. The First Service Command and the Military District of Washington, as in preceding months, had the lowest morbidity from venereal diseases, excluding EPTI, whereas the Second Service Command, with a rate of almost 40 per thousand had by far the highest rate. As in November, the Third Service Command continued to have a relatively high rate of morbidity from syphilis, excluding EPTI, its rate being more than double that for the United States as a whole.

The morbidity represented by venereal EPTI cases was reported in December at 27 per thousand strength or only slightly below record high rate for November. Variations in morbidity rates for venereal EPTI cases by Service Command have little significance because they reflect in part different geographical distribution of the Army relative to that of selectees, different proportions of white and colored inductees, differences in venereal diseases treatment facilities, and varying administrative practices.

Morbidity from all venereal diseases combined including EPTI cases has shown a steady upward trend since the beginning of 1943. The rate for December was only slightly lower than that for November which had been the highest so far reported.

NEUROPSYCHIATRIC DISORDERS

In previous reports there were shown the reported rates of total admissions from neuropsychiatric disorders. As pointed out, such rates overstated the actual morbidity from these causes to the extent that cases admitted to a station hospital and then transferred to a general hospital (or in some instances to another station hospital) were in many instances counted twice. In December, general hospitals were instructed to report neuropsychiatric admissions in a manner which made it possible to exclude transfer cases in computing the morbidity rate from these causes. On the basis of this reporting procedure a more proper and accurate measure of morbidity from neuropsychiatric disorders is now presented for both December 1943 and

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

previous months. The neuropsychiatric total admissions as reported for months prior to December 1943 were reviewed and modified on the assumption that the proportion of neuropsychiatric admissions to general hospitals which were actually found to be from "Command" or by change of disease classification was the same for months prior to December 1943 as reported for December 1943 (which was about 15 percent of the total admissions). The resulting series which more nearly represents a proper measure of neuropsychiatric admissions is shown in the chart on page 37. It should be noted that the revised admission rates may, if anything, be still slightly too high since some duplication on account of transfers between station hospitals has not been eliminated; it is believed however that such duplication is quite small. The revised Form 86ab now being put into effect provides for separate reporting of neuropsychiatric admissions as between direct admissions and transfers, not only for general hospitals but also for all stations. This should result in even more accurate admission rates from these causes being available in the future.

The rate of admission from neuropsychiatric disorders decreased slightly in December to a level of about 25 per thousand strength as compared with a revised rate of 28 per thousand for November. The Second Service Command showed the highest morbidity from this cause, whereas the Sixth and Ninth Service Commands had the lowest. Following the peak rate of 35 per thousand reached in August and September 1943, the neuropsychiatric admission rate has decreased each month, so that the current level is only about 15 percent above that for December 1942.

MEASLES, MUMPS, AND SCARLET FEVER

The admission rate from measles almost tripled in December as compared with November, while those from mumps and scarlet fever doubled, but all remained nevertheless below those reported for December 1942. The upward trend in morbidity from these causes began to manifest itself in December, just as in previous years.

MENINGITIS

In December morbidity from this cause doubled as compared with the relatively low level of the preceding three months, but nonetheless was well below the epidemic rates reached in the early part of 1943. Increases in morbidity from this cause were reported from all Service Commands.

RHEUMATIC FEVER

Morbidity from rheumatic fever in December continued on about the same level as in the preceding three months or considerably lower than in the spring months of 1943. Morbidity remains relatively high compared with that reported during most of 1942 at which time however there was considerable under-reporting of rheumatic fever. About half of the cases reported in recent months were from the Seventh Service Command. If the Seventh Service Command is excluded, the December 1943 admission rate for the remainder of the country is only .4 per thousand or about the same as the 1942 level.

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

TUBERCULOSIS

Morbidity from this cause decreased in December to less than 1 per thousand, the lowest reported in the past two years.

MALARIA

Morbidity from malaria acquired in the United States continued at the relatively low rate of only about .1 per thousand. On the other hand, malaria presumably acquired outside the United States showed an admission rate of 2.3 per thousand, the highest yet recorded. Whereas malaria acquired in the United States is chiefly concentrated in the Fourth, Eighth, and Ninth Service Commands, that acquired overseas is fairly uniformly distributed as between the various Service Commands.

MORTALITY

The mortality rate from all causes was reported at slightly over 2 per year per thousand strength during December which was about the same as in November and somewhat lower than the rate for the preceding six month period. Mortality from disease (which accounts for only about 20 to 25 percent of the mortality rate from all causes) was reported at .56 per thousand strength or slightly higher than during the preceding three months. Nonetheless, the mortality rate from disease for December 1943 was 20 percent lower than that for December 1942. All Service Commands showed low mortality from disease, but the Military District of Washington had the relatively high rate of more than 2 per thousand strength due chiefly to its older age constitution. The December mortality rate from injury was reported at 1.58 per thousand or almost the same as in November.

NON-EFFECTIVE RATE

The non-effective rate for December was 41.5 per thousand strength or about 10 percent higher than the corresponding rate for November (38.0 per thousand). This increase to the highest rate recorded for the United States in recent years was to a considerable extent the result of the higher admissions from colds, influenza, etc. previously discussed.

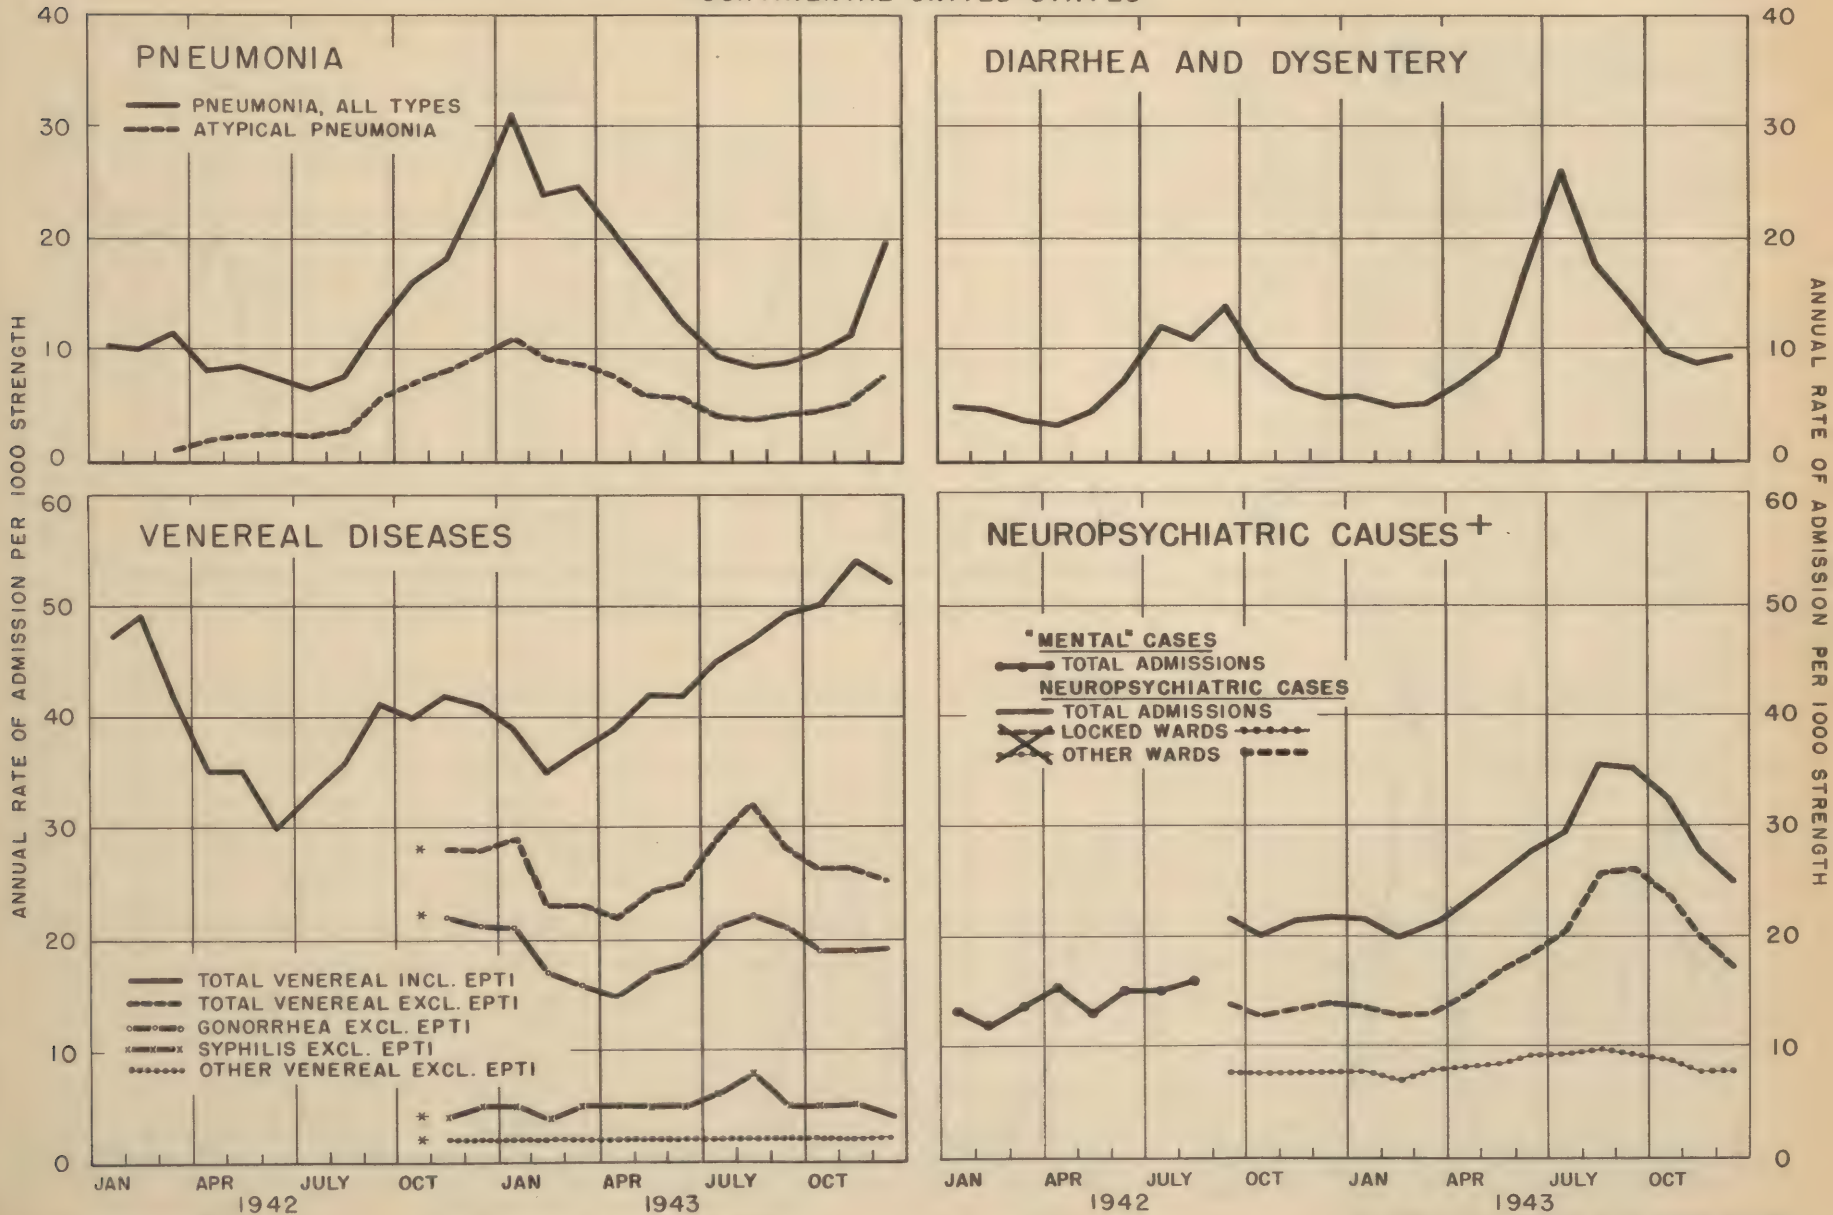

The variations in the non-effective rates by Service Command do not reflect so much the differences in morbidity between the Service Commands as the varying distribution of general hospitals. When comparison is made between the non-effective rates excluding general hospitals, the variations in the rates by Service Command are seen to be very much smaller than when the days lost in the general hospitals are included, as evidenced by the table below.

	Service Command									
	I	II	III	MDW	IV	V	VI	VII	VIII	IX
